Primate Grammar Lesson 1

Friday, August 14, 2020

To my knowledge, there is only one grammar teacher in the world. The sources which recognize this grammar teacher is the Bible, Plato, and Euclid, just to name a few.

Who is that grammar teacher? It is your own body. When one is ready to learn grammar, they then have to ask their own body; Body, what is a name, exactly what can I name, and how do I use those names to think, speak, and act in truth?

Since historically, given the Bible, Plato, Euclid, etc., it appears that all of these teachers have apparently been beyond the mental capability of the human race, let us take something more familiar, your computer. How many names for any thing does your computer use to process any information at all and can use to control any machine whatsoever? Just wait for it, you might get it.

Oh, well, over eighty years with the computer and not even the brainiac Chomsky can get it right: Two and these two are also called Binary. Binary is the intelligible basic one needs to learn grammar. Every possible thing in the whole Universe is composed of relative differences and the limits of those differences, or again, relatives and correlatives and if you are fortunate enough to know how to count, and find that the results is two, and then smart enough to know that binary, even dialectic, or even yoga, means two together then you don't go wondering off looking for some mythical third man science is always claiming will be found just around the corner or some self proclaimed prophet telling you, wait for it, your savior, someone who can think for you will be here shortly, while meanwhile these very same people are sucking your life dry. Christ simply said, don't go anywhere, you will see the savior when you see the buzzards over your own head or again, when you see the

abomination of desolation, or again, when the eyes of the blind are opened. How is it that one is more apt to claim that some dime-store evangelist, or some high official in a church all dressed up finer than a thousand dollar hooker, tells you something wholly contradicting what your own claimed savior does, makes sense to everybody but me. I guess when you say the end is such and such, and denote each with a different metaphor, you got to either have a memory, or write it down to see, they are all the same thing. It was lucky, or maybe just horny, I went looking for a girl instead. My luck radically changed when I found one. So, let us give ourselves a visual paradigm to work with so that we can keep its image in mind to remind us that there are two, and only two, parts of speech.

Here, Euclid shows you, you can name the relative, (for those who are not color blind, the green color), and one can name the correlatives, (the red dots as long as you are not so stupid as to think the dots are more than just hints that your pencil starts and stops there).

Now, if you go to Plato, he will tell you that all you can name is the elements of a thing as the relative and correlatives, or noun and verb. And if you play with your own pencil, and learn some geometry, you learn exactly the same thing. And if you learn Arithmetic from a decent book, you learn it is the same definition for one, 1, or a unit, a predicate pair. But, if you are a grammar teacher, well, you just parrot anyone's line of crap they have in their book; if anyone can teach that ignorance is bliss, it is the teachers we are given as part of social education. Grammar, as noted by Plato, was *Dialectic*, speaking with two together. Now if you want another grammar teacher, Patanjali, who taught it as parallel walking and used the metaphor of a yoke, you would be practicing what is called today, pretzel logic and practicing how not to think at all thanks to the illiterate mythologist of his work.

If you go back to the Bible, and solve the deliberate puzzles it puts to the reader, you end up back at Adam and Eve; Adam and Eve are a Conjugate Binary Pair which, by complete induction and deduction also known as recursion, produces the human race. If your computer had more of a brain than your body had, there would be an instant recognition of a soul mate. It is like that I.Q. test given to Superman. Where is the door to salvation? Well, you came into the world by Adam and Eve, and it is just as true intelligibly as it is perceptibly; here is the image of God, repeated throughout the Bible. Oh, well, no supermen here. I guess being born again is contingent upon recognizing where you were born to begin with.

They are called a Conjugate Binary Pair because they are inseparable as the two elements of every possible thing, limits and the material difference between the limits. Or as the song goes, a team of wild horses couldn't tear us apart! Now you know why a transistor is also called a logic gate, when it just means gated electricity; it is the same as the definition of a thing, itself.

After meeting Adam and Eve, you did not notice that the rest of the story was displaying addition, subtraction, multiplication and division of peoples did you?

Now, as long as we are not a non-Euclidean mythologist, or a religious mystic, or a moron for a grammar teacher or some swami claiming that taking a vacuum cleaner to your ear in order to empty your mind to reach the perfect state of tranquility, never mentioning that stepping in front of a bus doing sixty will be quicker, we next have to realize that since we have one and only one definition for one, how do we construct grammar systems with this? Or one can ask, how many grammar teachers does it take to screw just one? You simply could not count them all.

Well, we go back to our parents, Adam and Eve, or today, the computer, we construct grammar systems by recursion, in short, by adding, subtracting, multiplying, dividing, etc. Every possible system of grammar is constructed using standards of behavior in regard to the production of names based on the intelligible binary. This is called a convention of names. The rest of grammar is simply the standards of behavior in regard to operations with them, also known as recursion.

But, we have to first realize that a grammar system is, itself a binary, in case we have not forgotten already, it is a thing, after all. Now if we take the two elements of a thing, which are Universal and Intelligible, and pray like hell to some mystical pooka will magically endow us with enough brains to multiply these two against the two elements needed to produce a system of grammar we get Common Grammar, Arithmetic, Algebra and Geometry. It is wholly impossible to know grammar and not know it and teach it as a matrix. Or if you are as brain dead as our educators, you can teach anything using any mythology you like, cattle will eat almost anything. The two elements of a system of grammar are its symbol set, which is absolute, or one can say, the container, if one's brain can envision the above graphic as the two correlatives containing the relative, and all we have to do is determine the relative, or how we are going to use those symbols to make names with.

Eventually, we end up with four, and only four, categories of grammar, once again, not the countless numbers the air head brainiacs keep spouting off about like the grammar teachers insisting on many parts of speech, and the moron mathematicians trying to convince us that there are simply hordes of kinds of numbers, whole, counting, imaginary, real, finite and transfinite, and even transcendental complete with sitar music, numbers. Or even, my favorite;

> "The Nobel Prize in mathematics was awarded to a California professor who has discovered a new number! The number is bleen, which he claims belongs between 6 and 7."—George Carlin.

If we were a PhD toting intellectual, we would recite Aristotle:

> 'A part' may be a part either of the form (i.e. of the essence), or of the compound of the form and the matter, or of the matter itself. *Metaphysics* by Aristotle.

If you need someone to change the synonyms for you and recall the scattered particulars found throughout the text:

> A part of speech can be either the name for a limit, or the name of the relative difference, or the compound of both as a definition equates a limit to the predicate pair, one name for a relative and one name for the absolute, or again a noun and verb, which produces an example of a single recursion. 3 = 1 + 2. Or C = A + B. Or again, Tom is a cat. This is clearer in Socrates' dream for a dream passage in *Theaetetus*. This is also called *Class Mechanics* or so called *Set Theory*, something Plato got entirely correct, but every brainiac after him totally screwed.

and then immediately forget it and insist on something absurd. As every use of a unit, of 1, is done by recursion, exactly when does it become a transvestite number? And who has the most costume changes, the unit, squirrelly Mark, or diving Dian? Did anyone get that answer right on twenty questions? Other Greeks were more modest, the absolute, the relative, or a combination of both. A definition is simply the combination of two names. It must be embarrassing to be a grammar teacher and not be able to read. If one realize that assertion and denial are just more synonyms for our two parts of speech, we get Aristotle's judgment of our teachers and educators;

> "There are some who, as we said, both themselves assert that it is possible for the same thing to be and not to be, and say that people can judge this to be the case. And among others many writers about nature use this language. But we have now posited that it is impossible for anything at the same time to be and not to be, and by this means have shown that this is the most indisputable of all principles.—Some indeed demand that even this shall be demonstrated, but this they do through want of education, for not to know of what things one should demand demonstration, and of what one should not, argues want of education. For it is impossible that there should be demonstration of absolutely everything (there would be an infinite regress, so that

there would still be no demonstration); but if there are things of which one should not demand demonstration, these persons could not say what principle they maintain to be more self-evident than the present one.

We can, however, demonstrate negatively even that this view is impossible, if our opponent will only say something; and if he says nothing, it is absurd to seek to give an account of our views to one who cannot give an account of anything, in so far as he cannot do so. For such a man, as such, is from the start **no better than a vegetable**." *Metaphysics* by Aristotle, Ross

We would not go to a chef who didn't know what an egg was, but we go to grammar teachers who don't know what a name is: Curiouser and curiouser. Although Aristotle implied it above, let us remark, the place we start is called standards of behavior, the very definition, again, of one, one thing, a unit, binary. Every possible system of grammar is effected by standards of behavior the entire human race has always been too stupid to effect even though it defines the word civil. Effectively, the planet earth is still waiting for its first civilization.

Where was I? Oh yes. We get: Common Grammar, Arithmetic, Algebra and Geometry. Four specific methods of utilizing binary recursion to make judgments, map, and keep track of anything and every thing. And most importantly, if we realize that we use these grammar systems for the recursion of memory, which if you suck up on the stupid media giants of the world which produces an idiot that they then have to chase down the hole of stupidity until they can only hire brainless shock docs to get a rating, you might get bored enough then to actually learn how to use your body to learn and end up with memory to work with. Where was I again? Oh, yes, we use grammar systems for the recursion of memory and as long as we are not stupid and lazy, and can avoid the memory leaches, you can actually predict the future with it. A memory leach is the most dangerous form of life, for it releases a neurotoxin to lull its victims to sleep while it slowly drains their life blood. Now, I don't recall

having read that anywhere, but I am sure that if Van Hell-sinker was not waiting for daylight, he would be pursuing copyright infringement from all of the media corporate giants today. Me, I am already with my magical incantation to ward off the lot of them.

Off On Off

That is the perfect Mantra. The workings girls in Thailand said it differently, a buck, a buck, a buck. So, unlike our retarded educational systems which can find no end of subjects we just have to learn while graduating a complete and useless moron, and have to teach our self that a mind is the most powerful life support system possible if one can find a teacher that was more than dumber than a box of rocks, we can get on our way to learning how to think, speak, and act, as it was once said by Confucius, using names in accordance with the truth of things instead of getting high from snorting the ozone layer.

All we have to learn, in order to speak, think, and act, in truth, is four simple methods of binary recursion. Damned, how am I going to do that? Maybe we need to have some brain storming, congressional hearings, or fund fact finding corporations, or a global quorum of educator's having lunch at the U.N. or something. Sounds too complicated for me.

Isn't that odd how it works out? When you ignore your own body, you force yourself to be blind. No one else does it, but you. Or maybe, you were just too stupid to remember where you left your own body; hell yogis are leaving their body all the time, just like the rest of humanity. And you thought only yogis were sucking up the ozone layer!

Now you know how everybody can get a PhD while never once had to suffer the dread of meeting their own body. Wow, just think of it, the entire human race concurrently having an out of body experience called stupidity. Ain't this beautiful!

The first grammar lesson for everybody involves an introduction to the very same body within which you reside currently as a leach. So, take a few days, weeks, years, or lifetimes, and just go out like every other brain dead hippy looking for your self. Today, I still ask people if they have seen me walking around anywhere. The religious cannot find their savior, nor can the scientist find theirs. Everybody in the world seems to be homeless just like me.

Did you really think that you could treat anybody humanely when you are too stupid to know what a man is?

By biological fact, and by Biblical fact, the human mind is the life support system of your own body and the entire world around you. So, if you are too stupid to find your body, and locate the brain that is suppose to be in it, well, you are not ready to learn grammar. Your body is an absolute while your mind is a relative. So, if you are like me, you would say, intelligence is a relative, but sadly no relative of mine.

How to make your mouth a logic gate, just like a computer.

Take one glass of water, as warm or as cold as you like. Drink, but don't swallow. Then spurt it out a little at a time between your lips. You have just made gated water, or $20. Now, you can do the same with sound. With enough practice, you can learn to modulate the sound, and eventually, how to speak, without proclaiming to the world that you were born an idiot and chose to remain one.

Why, if you are really smart, you can ask any light switch connected to a working light bulb to learn to help you not only learn grammar, but turn the light on as well. How is that for multi-tasking? That is the poor man's computer unless he has to make his own fire with sticks.

I had been planning on starting my own Self-Realization Institute charging people $300 a pop or more, using just booths containing a light bulb connected to a switch in order to learn the secrets of the Universe,

the Two Witnesses of God, but I just never got the time, no watch. (If anyone sees that asshole from the Self-Realization Institute who conned me out of $600, I would like it back, with interest.)

I know, the intelligible matrix of grammar, which is needed to grow a brain, is still cheaper than the doctor who delivered you out of the first one, unless you go chasing after mystics and other dumb asses or form a government which can cheat you out of taxes to educate you into being dumber than you were born; at least then you had the brains enough to open your own eyes.

Perception determines conception, conception determines will. Or in a Metaphor, the Father, the Son, and the Holy Spirit are One. As Plato said through his metaphor of Socrates, we don't teach a thing to anyone, what we do is, by example, show children how to ask and answer questions. The first thing an education is suppose to do, is teach children about their own body and what it has to do with their own mind. Instead they are indoctrinated to be blind. Grammar is a biological product of that life support system called mind. Language, is the intelligible which expresses, or in a metaphor, is spoken, which produces every possible thing and it is the only power a mind can know or use, in a metaphor, God. If you want your children to be a dumb animal, you teach them to be no better than a dumb animal. If you want your children to be the children of God, you teach them that, the only power a mind has by which it saves not only the particular body, but the entire living biosphere called the Garden of Life, or this Earth. Until that day, buy a light switch to keep in your pocket and flip it on and off. Notice that when it is not connected to anything at all, absolutely nothing gets any brighter.
